

NativeServices.RegistryUserValueExists

Method	RegistryUserValueExists
Module	NativeServices
Library	Core
Action	For each user under HKU, tests whether a given value exists.
Parameters	Subkey (string): The registry key to look for. Name (string): The name of the registry value to check.
Return values	Exists (boolean): True if the value exists, false if it doesn't. Sid (string): SID of the user. Username (string): Domain\Username of the aforementioned SID.
Example	<pre>NativeServices.RegistryUserValueExists(Subkey:"Control Panel\\Colors", Name:"Hilight");</pre>
Platforms	<ul style="list-style-type: none">Windows
Notes	<p>There is a limit of 8192 values being returned. This limit applies to all users in total, <i>not</i> per user. This is currently not changeable.</p> <p>If information is retrieved from the <code>.DEFAULT</code> key or a <code>_Classes</code> key, the <code>Username</code> will be reported as "Unknown". It is possible to determine the owner of a <code>_Classes</code> key from the SID that precedes it (which will have a correct <code>Username</code>).</p> <div style="border: 1px solid red; padding: 5px;"><p> Warning This method may attempt to call AD to translate a SID to a username.</p></div>
