

Discovery.LookupNetBiosNames

Method	LookupNetBiosNames
Module	Discovery
Library	Discovery
Action	Performs a NetBios reverse lookup on a list of IP addresses
Parameters	<code>IpAddresses</code> (string): A list of IPv4 addresses in string notation separated by commas.
Return values	<code>IpAddress</code> (string): The IP address that was looked up. <code>HostName</code> (string): The resolved host name.
Example	Returns one row, as the IPv6 address is ignored. <pre>Discovery.LookupNetBiosNames (IpAddresses: "1.2.3.4, ::1");</pre>
Platforms	<ul style="list-style-type: none">Windows
Notes	This method will only resolve IPv4 addresses. IPv6 addresses will be ignored, and a warning will be logged. <div style="border: 1px solid red; padding: 5px;"> This method may request information over the wire. As such, it shouldn't be sent to a lot of machines. Staggering is also a recommended practice.</div>
