

# Nomad.Pause

<b>Method</b>	<b>Pause</b>
<b>Module</b>	Nomad
<b>Library</b>	1E
<b>Action</b>	Pause any currently-executing Nomad job. Has no effect if no job is currently running.
<b>Parameters</b>	(None)
<b>Return values</b>	<code>Success</code> (boolean): <code>true</code> if the request was successfully sent to Nomad, else <code>false</code> if Nomad is not installed, is not running, or is not a supported version.
<b>Example</b>	<pre>Nomad.Pause();</pre>
<b>Platforms</b>	<ul style="list-style-type: none"><li>• Windows</li></ul>
<b>Notes</b>	Because of the way Nomad works, this action sends a fire-and-forget request to Nomad. The return value reflects whether Nomad was able to accept the request, not necessarily whether Nomad acted on it. It is not an error if no Nomad job is currently running to be paused.
