

Patch Success Overview page

Summary

The overview page shows a dashboard with three charts and a pivot table, that are dynamically recalculated based on applied filters.

Without filters the dashboard shows the status of all devices in the selected inventory repository and all patches affecting them. When filters are added, the dashboard is recalculated according to the applied filter. For an explanation of filters, please refer to [Title and filter bars](#).

The totals on the title bar are not affected by filters. For more details about the title bar please refer to [Title and filter bars](#).

On this page:

- [Dashboard charts](#)
 - [Patch status per device](#)
 - [Security updates by severity level](#)
 - [Patch performance](#)
- [Interacting with the charts](#)
- [Pivot table](#)

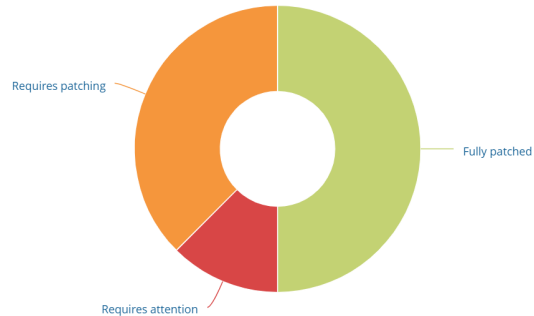

Dashboard charts

Patch status per device

Shows the overall patch status, after applying filters, by organizing devices into the following states ordered by priority:

- **Requires attention:** some required patches failed to install
- **Requires patching:** some required patches are missing
- **Requires rebooting:** some applied patches are pending a reboot
- **Fully patched:** all required patches have been applied successfully

Selecting a chart slice or label will apply a **Patch status** filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to [Title and filter bars: Filter types](#).

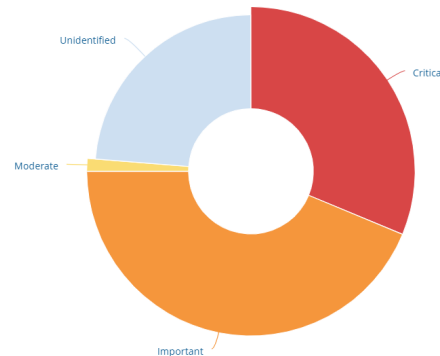

Security updates by severity level

Shows the security update spread, after applying filters, by organizing the security updates into their Microsoft security bulletin severities:

- **Critical**
- **Important**
- **Moderate**
- **Low**
- **Unidentified:** no assigned severity.

Selecting a chart slice or label will apply a **Severity** filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to [Title and filter bars: Filter types](#).

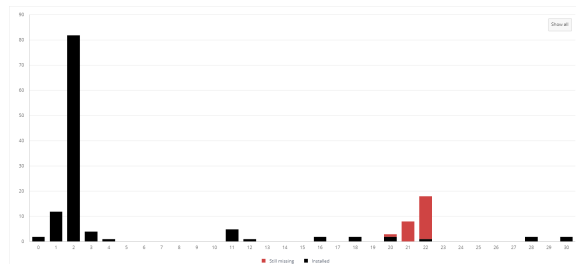

Patch performance

Shows the number of updates installed per day. The black column shows the days elapsed between the patch installation date and the publish date or the device's OS installation date (whichever is more recent). It also shows, as a red column, the required number of patches that are missing.

You can zoom in and out to highlight details of patches across time.

Selecting a chart bar or label will apply a **Time taken to install** range filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to [Title and filter bars: Filter types](#).

Interacting with the charts

You can click on chart slices and labels to add filters. Clicking on a slice or label once adds its filter, and clicking on it again removes its filter. Clicking with the CTRL key down allows you to add and remove multiple filters. For range charts clicking with the SHIFT key down allows you to select a range of filters.

The example picture opposite shows the previously filtered device and its 6 patches.
