

# Using Inventory

## Summary

How to use the Inventory application to view and export inventory, and manage associations.

Inventory can be reached directly using the following URL:

```
https://<tachyon DNS Name FQDN>/Tachyon/App/#/inventory
```

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading [Preparation: DNS Names](#).

In this section...

### Inventory features

The Inventory app captures data from different sources, then consolidates, normalizes and stores it in Inventory repositories.

### AI Powered Auto-curation

Describes the AI Powered Auto-curation feature that improves software inventory results.

### Manage associations

Applications and Packages in Configuration Manager are identified by a name and optionally publisher and version arbitrarily determined by the Configuration Manager administrator that created them. The Tachyon platform uses a standard format of Vendor, Title, Version and Edition to identify applications.

The **Manage Associations** section of Inventory enables an administrator to effectively normalize the Applications and Packages imported from Configuration Manager by associating them with a Vendor, Title, Version and Edition defined in the 1E Catalog. These associations are then used to define migration rules in [Application Migration 3.0](#) and reclaim rules in [AppClarity 7.0](#).
