

# 1E task sequence actions

In addition to the custom task sequence actions listed on this page, you may see additional custom action depending on the 1E OSD Tools that you have installed:

- [BIOS TO UEFI 1.4 - 1E OSD task sequence actions](#)
- [Nomad 7.1 - 1E OSD task sequence actions](#)

Please click on a heading below for more information about a custom task sequence action and its configuration.

## AppMigration

Application Migration uses a custom task sequence action that calls an Application Migration API. The API gets a list of Configuration Manager Applications and Packages that need to be installed on a computer based on previously installed software titles (determined through inventory) and the migration rules applying to those titles.

## Get migration settings

This action is available with 1E Nomad OSD Tools. It provides support for encryption in PBA. Also enables PBA to be used for computer replace scenarios. This task can be configured to run under either the capture phase or the restore phase. Its behavior differs depending on which phase it's run under.
