

NomadNeverUseSubnets

Prevents Nomad from using specific network adaptors based on the IP subnet. For example, this can be used to exclude Server backup subnets.

Registry value	Default value	Notes	Installer property
NomadNeverUseSubnets	" "	A comma-separated list of each subnet to be inhibited in CIDR notation. When Nomad is excluded from using a subnet, it attempts other cards available to that machine. If no other cards are available, Nomad will wait until one comes available. For example, 192.168.100.0/24	None.
