

1E BIOS to UEFI (deprecated)

This Task Sequence action allows the firmware changes to be made, and the device rebooted into Windows PE while preserving the task sequence environment. It is included in the task sequence twice. The first instance sets up the process before the firmware changes are made; the second runs after the changes have been made and restores the task sequence environment and allows it to continue.

This step is no longer required in Configuration Manager Current Branch (as of CM CB 1610).
